

BEAM'S CELL PHONE IDENTIFICATION SERVICE MODULE

CIS provides a nightly update identifying those phone numbers in your system that have been ported from a landline to a mobile line type or vice versa. This can be important in helping you avoid potential liability for calling mobile numbers on a dialer and can save money by preventing charges for text messages sent to a landline. This subscription will update line type information whenever a number is ported in addition to updating any numbers that are added to your system during the day.

Reliability

Our integration partners provide the latest information on ported mobile numbers.

Timesaving

You do not have to dedicate resources to data import and exports.

Efficient & Automated

Nightly downloads and updated consumer phone information occur automatically.

Identify

Beam's CIS module enables you to identify the phone numbers that could cause compliance issues under TCPA.

Why choose BEAM?

- Avoid charges for text messages sent to landline numbers.
- Avoid potential liability for TCPA violations.

Intuitive • Compliant • Modular
